

Identification print on the reverse side of Trespa® panels

As a result of Trespa's on-going product development we are pleased to announce a significant improvement of the identification print on the reverse-side of Trespa® single-sided decorative panels.

This improvement is achieved by applying laser printing technology, therefore enabling better readability of the print.

Typical reverse side print appearance:

Quality of current print

Quality of improved print (laser print)

The new improved print provides better traceability with a unique 10 digit code printed on the reverse-side of every single-sided decorative panel.

The above improvements are relevant for the following Trespa products:

Panel type	Product Line
Single sided panels	Meteon® Virtuon® Toplab Plus® Toplab Vertical® Pura NFC®

The following will not change:

- The coding used to indicate the grade of the panel (FR / STANDARD).
- The coding used for ICC certification (ESR-1687).
- Identification of double-sided decorative panels.

The implementation of the laser print in Trespa manufacturing commenced during the 2nd half of January.
